

The photovoltaic panel current is lower than the device

Overview

A solar panel is roughly a current source over most of its characteristic, and the impedance of the load is setting the operating point's voltage, which is much lower than the panel's voltage at its MPP. At its MPP, it would be delivering more power than is needed.

History of PV Systems
The movement of electrons, which all carry a negative charge, toward the front surface of the PV cell creates an imbalance of electrical charge between the cell's front and back surfaces. This imbalance, in turn, creates a voltage potential similar to the negative and positive terminals of a battery. Electrical conductors on the PV cell absorb the See more on eia.gov
