

Working principle of inner blade generator

Overview

The wind does not "push" the turbine blades, but instead when the wind flows across and past a turbine blade, the difference in the pressure on either sides of the blade produces a lifting force, causing the rotor to rotate and cut across the wind.

Working Principle of Wind Turbine

It swivels the blades to align with wind speed, ensuring they capture the most wind energy efficiently. The nacelle, or the turbine's body, can rotate to

How a Wind Turbine Works

When wind flows across the blade, the air pressure on one side of the blade decreases. The difference in air pressure across the two sides of the blade creates both lift and drag. The force of the lift is

How a Wind Turbine Works

Wind turbines work on a simple principle: instead of using electricity to make wind-like a fan- wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor,
